

Q1

Fill in the blanks to create the correct data type for each variable and print its type.

```
name      = ____("Ali")      # convert to string
score     = ____ (95.7)      # convert to integer
passed    = ____ (1)         # convert to boolean
missing   = ____             # no value

print(type(name))
print(type(score))
print(type(passed))
print(type(missing))
```

Q2

What will this code print? Write your answers in order.

```
x = 10
y = 3
print(x + y)
print(x // y)
print(x % y)
print(x ** 2)
print(type(y))
```

Q3

This code has **3 bugs**. Find and fix them all.

```
s = "  Hello Python  "
print(s.Strip())           # remove spaces
print(s.replace("Python" "World")) # replace word
print(len[s])              # length
```

Q4

What will each line print? Write all 6 answers.

```
age = 22
print(age > 18 and age < 30)
print(age < 10 or age > 80)
print(not (age == 22))
print(18 <= age <= 30)
print(age == "22")
print(bool(0))
```

Q5

Fill in the blanks to complete all list operations correctly.

```
subjects = ['Math', 'Physics', 'CS', 'English', 'Chemistry']

print(subjects[____])      # print last item
print(subjects[____:____]) # print first 3 items
subjects.____('Biology')  # add to end
subjects.____('Physics')  # remove Physics
print(subjects)
print(____(subjects))      # print total count
```

Q6

This code has **4 bugs**. Fix them so it runs correctly.

```
scores = (85, 92, 78, 96, 70)    # should be a list

print(sum[scores])
print(Max(scores))
print(f'Average: {sum(scores) / len(scores):.4d}')
```

Q7

What will this code print? Write all 5 answers in order.

```
params = {'lr': 0.01, 'epochs': 50, 'batch': 32}

print(params['epochs'])
print(params.get('dropout'))
print(params.get('dropout', 0.5))
params['epochs'] = 100
print('lr' in params)
print(list(params.keys()))
```

Q8

Fill in the blanks to complete this grading program. Each blank is one word or symbol.

```
score = 73

___ score >= 90:
    print('A')
___ score >= 80:
    print('B')
___ score >= 70:
    print('C')
___:
    print('F')

# Bonus: rewrite the 70-check as a chained comparison
___ 70 <= score ___ 79:
    print('Score is in the C range')
```

Q9 — Hard

Fix the bug

This function should return a tuple of (min, max, average) and unpack it. It has 3 bugs. Find and fix all of them.

python

```
def summarise(lst):  
    lo = Min(lst)  
    hi = max(lst)  
    avg = sum(lst) / Len(lst)  
    return lo, hi, avg  
  
minimum, maximum = summarise([4, 17, 9, 23, 5])  
print(f'Min={minimum:.2f}, Max={maximum:.2f}, Avg={average:.2f}')
```
